

**ABSTRACT**

A system and method for providing a dry consumable with a liquid in the same assembly. The assembly includes a fluid container that is covered with a cap assembly. The cap assembly can be manually opened and closed, thereby selectively controlling the flow of fluid out of the fluid container. Consumable material is formed into a solid form on the exterior of the cap assembly. The material can include pharmaceutical compounds, nutraceutical compounds or can be inert compounds, such as confections. The material is formed into a solid that can be bitten or licked away from the cap assembly as the cap assembly is placed in the mouth. Once the material is received into the mouth, liquid can be drunk through the cap assembly to help wash the material down the throat.
